Paper 3 Advanced Practical Skills 2

May/June 2026

MARK SCHEME

Maximum Mark: 40

Published

This mark scheme contains the instructions and marking guidance that our examiners used to mark candidate responses for this component.

Before they start marking, examiners complete a standardisation process. They review a range of candidate responses and discuss the mark scheme in detail to agree which answers can and cannot be accepted. Examiners award marks where it is clear that candidate responses have met the requirements of the mark scheme. These requirements may vary between different components or different versions of the same component, depending on the exact requirements of the question and the candidate responses seen during the standardisation process.

Sometimes, our mark schemes may allow marks to be awarded to responses which contain elements that are factually incorrect or for content not covered by the syllabus. We do this in response to the demands of a specific question to support candidates and make sure that our assessments are fair. However, these allowances should not be used as a guide for teaching and learning.

We cannot discuss the mark scheme with schools, and we recommend that schools read the mark scheme together with the assessment material and the Principal Examiner Report for Teachers.

This document consists of **17** printed pages.

General marking principles

All examiners must apply these marking principles when marking candidate responses.

1	Examiners must award marks for each response in line with: - the specific content defined in the mark scheme - the specific skills defined in the mark scheme or in the level descriptions - the standard of response required as exemplified by the standardisation scripts.
2	Examiners must award whole marks (not half marks, or other fractions).
3	Examiners must award marks positively . This means that: - marks are not deducted for errors or omissions - marks are awarded for correct/valid answers as defined in the mark scheme and also for other valid answers which go beyond the scope of the syllabus and mark scheme referring to your team leader as appropriate - the quality of spelling, punctuation and grammar are judged only when the mark scheme indicates that these features are specifically assessed in the question. However, the meaning of all responses must be unambiguous.
4	Examiners must consistently apply the requirements of the mark scheme and any rules for what to do when candidates have not followed instructions correctly.
5	Examiners must use the full range of marks defined in the mark scheme, unless limited by the quality of the candidate responses seen.
6	Examiners must award marks according to the mark scheme and must not award marks with grade thresholds or grade descriptions in mind.

Science-Specific Marking Principles

1	Examiners should consider the context and scientific use of any keywords when awarding marks. Although keywords may be present, marks should not be awarded if the keywords are used incorrectly.
2	The examiner should not choose between contradictory statements given in the same question part, and credit should not be awarded for any correct statement that is contradicted within the same question part. Wrong science that is irrelevant to the question should be ignored.
3	Although spellings do not have to be correct, spellings of syllabus terms must allow for clear and unambiguous separation from other syllabus terms with which they may be confused (e.g. ethane / ethene, glucagon / glycogen, refraction / reflection).
4	The error carried forward (ecf) principle should be applied, where appropriate. If an incorrect answer is subsequently used in a scientifically correct way, the candidate should be awarded these subsequent marking points. Further guidance will be included in the mark scheme where necessary and any exceptions to this general principle will be noted.
5	<u>'List rule' guidance</u> For questions that require <i>n</i> responses (e.g. State two reasons ...): • The response should be read as continuous prose, even when numbered answer spaces are provided. • Any response marked <i>ignore</i> in the mark scheme should not count towards <i>n</i>. • Incorrect responses should not be awarded credit but will still count towards <i>n</i>. • Read the entire response to check for any responses that contradict those that would otherwise be credited. Credit should not be awarded for any responses that are contradicted within the rest of the response. Where two responses contradict one another, this should be treated as a single incorrect response. • Non-contradictory responses after the first <i>n</i> responses may be ignored even if they include incorrect science.

6 Calculation specific guidance

Correct answers to calculations should be given full credit even if there is no working or incorrect working, **unless** the question states 'show your working'.

For questions in which the number of significant figures required is not stated, credit should be awarded for correct answers when rounded by the examiner to the number of significant figures given in the mark scheme. This may not apply to measured values.

For answers given in standard form (e.g. $a \times 10^n$) in which the convention of restricting the value of the coefficient (a) to a value between 1 and 10 is not followed, credit may still be awarded if the answer can be converted to the answer given in the mark scheme.

Unless a separate mark is given for a unit, a missing or incorrect unit will normally mean that the final calculation mark is not awarded. Exceptions to this general principle will be noted in the mark scheme.

7 Guidance for chemical equations

Multiples / fractions of coefficients used in chemical equations are acceptable unless stated otherwise in the mark scheme.

State symbols given in an equation should be ignored unless asked for in the question or stated otherwise in the mark scheme.

Annotations guidance for centres

Examiners use a system of annotations as a shorthand for communicating their marking decisions to one another. Examiners are trained during the standardisation process on how and when to use annotations. The purpose of annotations is to inform the standardisation and monitoring processes and guide the supervising examiners when they are checking the work of examiners within their team. The meaning of annotations and how they are used is specific to each component and is understood by all examiners who mark the component.

We publish annotations in our mark schemes to help centres understand the annotations they may see on copies of scripts. Note that there may not be a direct correlation between the number of annotations on a script and the mark awarded. Similarly, the use of an annotation may not be an indication of the quality of the response.

The annotations listed below were available to examiners marking this component in this series.

Annotations

Annotation	Meaning
	Correct point or mark awarded
	Incorrect point or mark not awarded
	Information missing or insufficient for credit
	Benefit of the doubt given
	Contradiction in response otherwise markworthy, mark not given
	Error in number of decimal places
	Error carried forward applied
	Incorrect or insufficient point ignored while marking the rest of the response
	Rounding error
	Repeat error
 or /	Blank page or part of script seen

Annotation	Meaning
SF	Error in number of significant figures
TE	Transcription error

Mark Scheme abbreviations

/	alternative responses for the same marking point
R	reject the response
A	accept the response
I	ignore the response
ecf	error carried forward
AVP	any valid point
ora	or reverse argument
AW	alternative wording
<u>underline</u>	actual word given must be used by candidate (grammatical variants excepted)
()	the word / phrase in brackets is not required but sets the context
max	indicates the maximum number of marks that can be given
M	marking point
ppt	precipitate
sf	significant figures

When awarding accuracy marks in **Question 1** record:

- candidate number
- candidate ΔT ($T_{\text{max}} - T_o$)
- difference (δ) from supervisor value
- mark awarded

When awarding accuracy marks in **Question 2** record:

- candidate number
- candidate ratio ($\frac{\text{mass of FB3}}{\text{mass of residue}}$)
- mark awarded

In either question, where more than half the candidates score no marks against the supervisor value, **please contact your team leader (TL)**.

Reject either a rounding error (RE) or a transcription error (TE) only once in the paper. Note: Reject REs only in ‘correctly calculates’.
Reject fractions in place of decimal answers only once in the paper.

Practical issues at a centre sometimes mean that candidates cannot access all of the marks. In such cases, contact your TL. Candidate marks may need to be scaled.

Restarts: In calculations sections of quantitative analysis questions, candidates may gain credit in a question part by using either a previous incorrect answer **or** they may ‘restart’ the calculation using their experimental data correctly. Annotate either ‘ecf’ or ‘allow: restart’.

Question	Answer	Marks	Guidance
1(b)(i)	M1 Temperature on y-axis and time on x-axis and axes clearly labelled with unambiguous names or units and some numbers for scales	1	A temp., T (for temperature axis name). A t (for time axis name). A min, mins for minutes. A time scale in seconds. R C (alone), $^{\circ}\text{C}$ for temp. R m for units of time.
	M2 Linear scales based on 1, 2 or 5 per large square and include (space for) 10.0°C above maximum temperature (T_{max}) recorded and scales chosen so that points plotted cover <u>more than</u> half of each axis (i.e. > 5 large squares up y-axis covered by plot points)	1	A scales based on 4, 10, 20 etc. per large square. R other scales based on e.g. 3, 7, 9 etc. R if any part of the scale is non-linear, including the ends not used for plotting. A if data are not plotted. A graph rotated to fit landscape. IF $\Delta T \geq 40^{\circ}\text{C}$, then for > 50% axis used, measure from lowest point to $T_{\text{max}} + 10^{\circ}\text{C}$.
	M3 All recorded points plotted correctly to within half a small square and in the correct square If fewer than 20 readings recorded in (a) , A minimum 14 recorded and plotted – but all recorded temperatures must be plotted	1	R if scale is non-linear in the region of plotting, but I non-linear regions beyond plot. A if scale is not based on 1, 2, 4, 5 or 10. I point plotted at $t = 2$ min in line with first four points. Scan all points. Closely check $t = 0$, max T and final T . Check spacing of points along x-axis – should be even (excluding gap at $t = 2$ min). Annotate script with a small dot on the x-axis scale or near point for each point checked. If the point should be on a line, it must be on the line (you should <u>not</u> be able to see white space between the plot and the axis line). If it should not be on the line, it must not be so. Blobs/crosses should be less than $\frac{1}{2}$ a small square across and be correctly centred.

Question	Answer	Marks	Guidance
1(b)(i)	M4 Two lines of best fit drawn and extrapolated to $t = 2$ minutes Left-hand line must be a straight line Right-hand line must be a smooth curve	1	A (maximum of) 2 points to be circled or labelled as anomalous. R additional lines of best fit. Left-hand line: if 3 temperatures are the same (1 different), then line must be horizontal. Right-hand curve must not be an S-shape.
1(b)(ii)	Correctly uses the graph to determine ΔT at 2 minutes and answer given to 1 decimal place	1	MUST have working shown on graph. Minimum is vertical line at $t = 2$ min connecting the two lines of best fit. Or a mark on (or near) y -axis where RH line crosses $t = 2$ min. A reading from y -axis within $\frac{1}{2}$ small square. A T_0 either from table or read from graph A 2 dp if value read from y -axis correct to 2dp. R integer value. R if right hand line lower than $T_{\max}$ where it crosses $t = 2$ mins unless $T_{\max}$ labelled anomalous.
1(c)(i)	(appearance of filtrate): colourless (solution) and (appearance of residue): pink-brown (solid/powder)	1	I clear, transparent etc. for colourless. A 'no colour'. A pink / (dark) brown / black / black-grey / dark-grey. R red. R grey (alone).

Question	Answer	Marks	Guidance
1(c)(ii)	M1 Selects sodium hydroxide (aqueous) and selects NH ₃ (aqueous)	1	A selects (aqueous) ammonia only and white ppt and soluble in excess for M1 and M2 ✓✓.
	M2 Observation for both is: white ppt and soluble in excess	1	I additional reagents and observations.
	M3 M is Zn / zinc	1	M3 is dependent on correct observations in M2 . A Zn ²⁺ (charge must be correct). NO ECF for M3 from incorrect tests / observations.
1(d)(i)	Zn(s) + Cu ²⁺ (aq) → Zn ²⁺ (aq) + Cu(s) or M (s) + Cu ²⁺ (aq) → M ²⁺ (aq) + Cu(s)	1	State symbols required. ECF from incorrect conclusion in (c)(ii) only IF the metal selected is more reactive than Cu (even if not in QA table on p10).
1(d)(ii)	Correctly calculates energy change = 25 × 4.18 × Δ <i>T</i> (J) and answer given to 2–4 significant figures	1	A use of Δ <i>T</i> from graph or table. ECF use of incorrect Δ <i>T</i> from 1(b)(ii) . I signs. R c = 4.2 used in working. IF no working, final answer must be correct to 3–4 sf. Do not penalise sf more than once in 1(d) .
1(d)(iii)	M1 shows use of data to calculate amount of CuSO ₄ = 0.95 × ²⁵ / ₁₀₀₀ (mol) = 0.024 / 0.0238 / 0.02375	1	M1 answer, if given, must be to 2 – 4 sf. R if evaluated = 0.02 (1sf).
	M2 working to show enthalpy change Δ <i>H</i> _r = ^{(d)(ii)} / (1000 × answer to M1) (kJ mol ⁻¹) and negative sign shown and final answer given to 2–4 significant figures	1	ECF M2 from M1 (e.g. use of 0.95 as moles). Expected answer Δ <i>H</i> _r = – ^{(d)(ii)} / 23.75 (kJ mol ⁻¹) ✓✓.

PUBLISHED

Question	Answer	Marks	Guidance
2(a)	M1 Unambiguous headings and correct units to cover 7 entries All data in a single table (mass of) crucible and lid (mass of) crucible, lid and FB3/hydrated salt / $\text{CuSO}_4 \cdot x\text{H}_2\text{O}$ (mass of) crucible, lid and contents/anhydrous salt / CuSO_4 (mass of) crucible, lid and contents/etc after reheating (mass of) FB3 / hydrated salt / $\text{CuSO}_4 \cdot x\text{H}_2\text{O}$ (mass of) residue/anhydrous salt / CuSO_4 (mass) loss / water lost / water and Unit for all seven pieces of data recorded: / g, (g), in g	1	A consistent omission of lid. R weight for mass. A two tables (balance readings and calculations). A residue for anhydrous salt. A dehydrated for anhydrous. R FB3 in headings <u>after heating</u>. Third and fourth reading must be distinguished. e.g. 'contents' then 'residue' as implied in the method. A on heating / cooling 1 and on heating / cooling 2. A unambiguous heading for a third heating. I calculated 'mass of residue after 1st heating'. A in grams / grammes. R gram, / (g), (/ g).
	M2 All balance readings given consistently either to 2 or to 3 decimal places (dp) and final heating within +0.02 to –0.05 g of previous heating M3 Correct subtractions to determine mass of FB3 used and mass of residue and mass of water lost	1	A 4 dp. A 1 dp only if use of 1 dp balances is stated in the supervisor's report. IF 1dp balance used, final two readings after heating must be identical. R if any balance reading is impossible. A values seen next to appropriate line in method. IF mass on second heating is greater than mass on first heating, candidate may use either value. Do not read subtractions from part (b).
	Check and correct subtractions for supervisor and candidates. If mass on second heating is greater than mass on first heating, use mass from first heating to determine ratio. Calculate supervisor's mass ratio = $\frac{\text{mass FB3}}{\text{mass residue}}$ to 2 dp. Write and ring this value on each candidate's script. Calculate and record (near the results table) the candidate's mass ratio to 2 dp		
	M4 Award if candidate's mass ratio is within 10% of supervisor value	1	IF fewer than 50% of candidate score M4 , consider using default of 1.56.

Question	Answer	Marks	Guidance
2(b)(i)	Correctly calculates amount of $\text{CuSO}_4 = \text{mass of residue} / 159.6$ (mol) and answer given to 2–4 sf	1	A correct string of A_r s for 159.6. A use of their value from the table in (a) or a correct restart value. R incorrect M_r used in working. Do not penalise sf more than once in 2(b) . Do not penalise sf if already penalised in 1(d) .
2(b)(ii)	M1 correctly calculates amount of water = $(\text{mass of FB 3} - \text{mass of residue}) / 18$ (mol) and answer given to 2–4 sf	1	ECF use of mass of residue in (b)(ii) IF mass of water lost was used in (b)(i) . A use of incorrect subtractions in (a) . A alternative method: $\left[\frac{\text{mass FB3}}{\text{(b)(i)}} - 159.6 \right] / 18$
	M2 shows use of amount of water / (b)(i) and answer is an integer	1	R non-integer values of x . R x = 0 .
2(c)	(residue is) white / grey * solid * (solid) turns blue * forms blue solution * 'steam' / crucible warms up / fizzing sound / popping sound * 2* = 1 mark	2	I residue for solid. R ppt for solid. A blue-green solution. I fizzing (alone). 5 * available, round down.
2(d)(i)	copper oxide / CuO (formed) or sulfate / CuSO_4 decomposes / (anhydrous solid / residue) undergoes further decomposition	1	R burns / combusts / oxidises.

PUBLISHED

Question	Answer	Marks	Guidance
2(d)(ii)	Mass loss increases therefore 'x' increases	1	A 'it' for 'x'. A mass of anhydrous salt will be smaller therefore 'x' increases. A change would be (very) small so wouldn't make difference to overall integer value for 'x'. I <i>calculated</i> moles of water will be greater. R more water is lost/removed.

Question	Answer	Marks	Guidance
FB 4 is a mixture of CuCO_3 and $\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$			
3(a)	green (solid) * powder and crystals * (on gentle heating) (solid/powder) turns black * condensation * (stronger heating) (black) solid jumps around * gas turns (damp blue) litmus red * white specks / solid turns grey * white fumes * 2 * = 1 mark, maximum 3 marks	3	A UI paper in place of litmus. A gas forms white ppt * with limewater * but record the mark in 3(b) – see below. 8 * available – round down.

PUBLISHED

Question	Answer	Marks	Guidance
